REC-CIS GE23131-Programming Using C-2024 Quiz navigation Status Finished Started Monday, 13 January 2025, 11:03 AM Completed Monday, 13 January 2025, 11:11 AM Show one page at a time **Duration** 7 mins 52 secs Finish review Question 1 Given an array of numbers, find the index of the smallest array element (the Correct pivot), for which the sums of all elements to the left and to the right are equal. ▼ Flag The array may not be reordered. question Example arr=[1,2,3,4,6] the sum of the first three elements, 1+2+3=6. The value of the last element is 6. Using zero based indexing, arr[3]=4 is the pivot between the two subarrays. The index of the pivot is 3. **Function Description** Complete the function balancedSum in the editor below. balancedSum has the following parameter(s): int arr[n]: an array of integers Returns: int: an integer representing the index of the pivot Constraints $3 \le n \le 10^5$ $1 \le arr[i] \le 2 \times 10^4$, where $0 \le i < n$ It is guaranteed that a solution always exists. Input Format for Custom Testing Input from stdin will be processed as follows and passed to the function.

The first line contains an integer n, the size of the array arr. Each of the next n lines contains an integer, arr[i], where $0 \le i < n$. Sample Case 0 Sample Input 0 STDIN Function Parameters 4 \rightarrow arr[] size n = 4 2 3 3 Sample Output 0 2 Explanation 0 3. subarrays. Sample Case 1 Sample Input 1 STDIN Function Parameters 2

 \rightarrow arr = [1, 2, 3, 3]

The index of the pivot is 2.

 \rightarrow arr[] size n = 3

 \rightarrow arr = [1, 2, 1]

The first and last elements are equal to 1.

The index of the pivot is 1.

Passed all tests! <

numbers = [3, 13, 4, 11, 9]

Function Description

The sum is 3 + 13 + 4 + 11 + 9 = 40.

Complete the function arraySum in the editor below.

arraySum has the following parameter(s):

int numbers[n]: an array of integers

int: integer sum of the numbers array

Using zero based indexing, arr[1]=2 is the pivot between the two

* Complete the 'balancedSum' function below.

int balancedSum(int arr_count, int* arr)

for (int i=0;i<arr_count;i++){</pre>

for(int i=0;i<arr_count;i++){</pre>

if(leftsum==rightsum){

totalsum+=arr[i];

return i;

leftsum+=arr[i];

int totalsum = 0;

int leftsum=0;

return 1;

int arr[] = $\{1,2,3,3\}$;

Calculate the sum of an array of integers.

printf("%d", balancedSum(4, arr))

* The function is expected to return an INTEGER.

 \ast The function accepts <code>INTEGER_ARRAY</code> arr as parameter.

int rightsum = totalsum - leftsum - arr[i];

Expected Got

2

✓

The sum of the first two elements, 1+2=3. The value of the last element is

Using zero based indexing, arr[2]=3 is the pivot between the two

Sample Output 1 **Explanation 1** subarrays. **Answer:** (penalty regime: 0 %)

Question **2**

Correct ▼ Flag question

Question $\bf 3$ Correct ▼ Flag question

Constraints $1 \le n \le 10^4$ $1 \le numbers[i] \le 10^4$ Input Format for Custom Testing Input from stdin will be processed as follows and passed to the function. The first line contains an integer n, the size of the array numbers. Each of the next n lines contains an integer numbers[i] where $0 \le i < n$. Sample Case 0 Sample Input 0 STDIN Function \rightarrow numbers[] size n = 5 \rightarrow numbers = [1, 2, 3, 4, 5] Sample Output 0 Explanation 0 1 + 2 + 3 + 4 + 5 = 15. Sample Case 1 Sample Input 1 **Function** STDIN \rightarrow numbers[] size n = 2 \rightarrow numbers = [12, 12] Sample Output 1 **Explanation 1** 12 + 12 = 24. **Answer:** (penalty regime: 0 %) Reset answer 1 • /* 2 3 6 7 9 , int sum = 0; 10 11 • sum=sum+numbers[i]; 12 13 14 return sum; 15 16 **Test** int arr $[] = \{1,2,3,4,5\};$ 15 printf("%d", arraySum(5, arr)) Passed all tests! < **Answer:** (penalty regime: 0 %) Reset answer 1 | /* 3 #include <stdlib.h> return (*(int*)a - *(int*)b); 9 10 11 12 13 ▼ { 14 int totaldiff=0; 15 for(int i=1;i<arr_count;i++){</pre> 16 17 18 19 return totaldiff; 20 21 **Test** int arr $[] = \{5, 1, 3, 7, 3\};$ printf("%d", minDiff(5, arr))

* Complete the 'arraySum' function below. * The function is expected to return an INTEGER. * The function accepts INTEGER_ARRAY numbers as parameter int arraySum(int numbers_count, int *numbers) for(int i=0;i<numbers_count;i++){</pre> **Expected Got** 15 Given an array of n integers, rearrange them so that the sum of the absolute differences of all adjacent elements is minimized. Then, compute the sum of those absolute differences. Example n = 5 arr = [1, 3, 3, 2, 4] If the list is rearranged as arr' = [1, 2, 3, 3, 4], the absolute differences are |1 - 2| = 1, |2 - 3|= 1, |3 - 3| = 0, |3 - 4| = 1. The sum of those differences is 1 + 1 + 0 + 1 = 3. Function Description Complete the function minDiff in the editor below. minDiff has the following parameter: arr: an integer array Returns: int: the sum of the absolute differences of adjacent elements Constraints 2 ≤ n ≤105 0 ≤ arr[i] ≤ 109, where $0 \le i < n$ Input Format For Custom Testing The first line of input contains an integer, n, the size of arr. Each of the following n lines contains an integer that describes arr[i] (where $0 \le i < n$) . Sample Case 0 Sample Input For Custom Testing STDIN Function ----- $5 \rightarrow arr[]$ size $n = 5.5 \rightarrow arr[] =$ [5, 1, 3, 7, 3] 1 3 7 3 Sample Output 6 Explanation n = 5 arr = [5, 1, 3, 7, 3] If arr is rearranged as arr' = [1, 3, 3, 5, 7], the differences are minimized. The final answer is |1 - 3| + |3 - 3| + |3 - 5| + |5 - 7| = 6. Sample Case 1 Sample Input For Custom Testing STDIN Function ----- 2 \rightarrow arr[] size n = 2 3 \rightarrow arr[] = [3, 2] 2 Sample Output 1 Explanation n = 2 arr = [3, 2] There is no need to rearrange because there are only two elements. The final answer is |3 - 2| = 1. * Complete the 'minDiff' function below. * The function is expected to return an INTEGER. * The function accepts INTEGER_ARRAY arr as parameter. int compare(const void *a, const void *b){ int minDiff(int arr_count, int* arr) qsort(arr,arr_count,sizeof(int),compare); totaldiff+=abs(arr[i]-arr[i-1]); **Expected Got** 6 Passed all tests! < Finish review
